

What are the benefits of our Hybrid SuDS Planter?

Meristem's innovative modular system combines the benefits of a rain garden with a SuDS planter, avoiding the need for deep excavation and disrupting utilities while reducing costs.

How does it work?

Capture: Rainwater flows down and into the planter from surface-level drains.

Storage: The aquifer base layer holds and absorbs the rainwater.

Capillary Rise: The stored water irrigates the soil, keeping the plants watered.

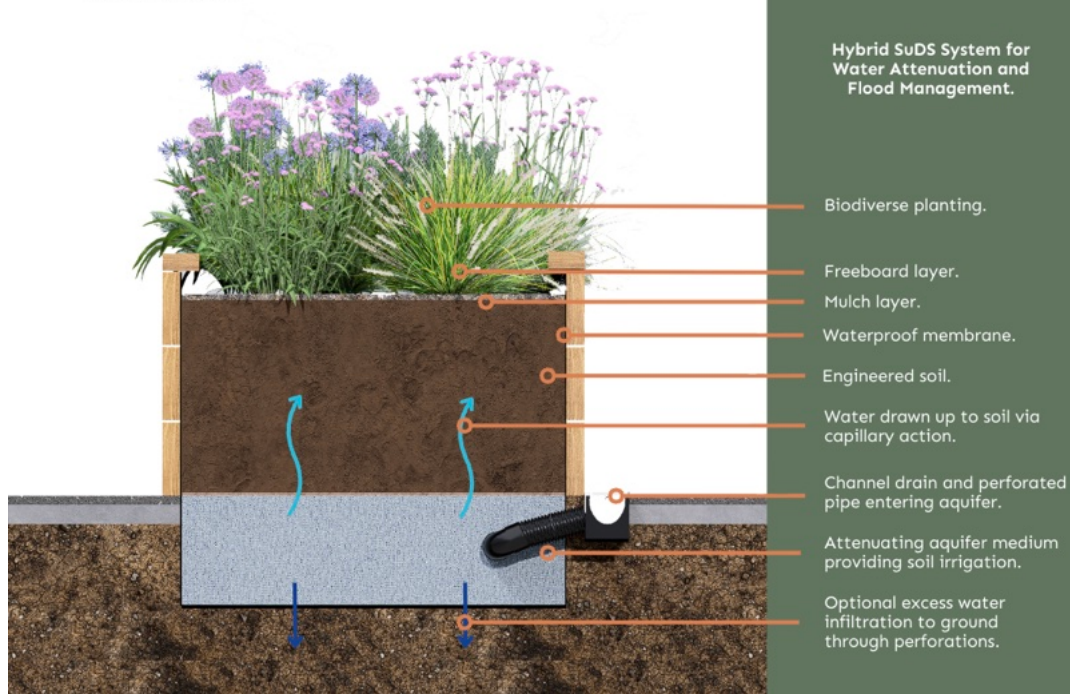

Gradual Release: Excess water evaporates or drains into the local system.

Hybrid SuDS Planters

Combines innovative SuDS Planters technology with Rain Gardens

Hybrid SuDS System for Water Attenuation and Flood Management.
